

Map (I) :-

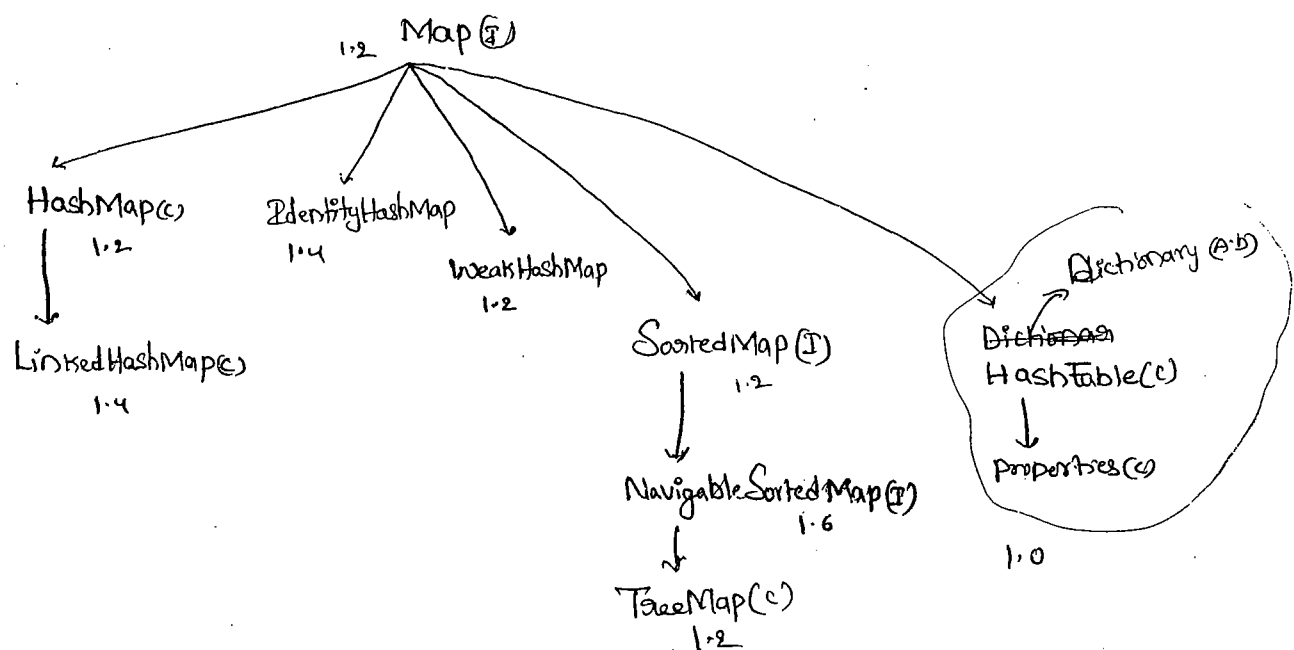

- If we want to represent a group of objects as key-value pairs then we should go for Map. Both Key & Value are Objects.
- Both Key & values are Objects.
- Duplicate Keys are not allowed, But values can be duplicated.
- Each key-value pair is called Entry.

exl.

Rollno	name
101	divya
102	Sainu
103	Ravi
104	Sambu
105	Sunder

key → value

- There is no relationship b/w Collection & Map.
- *Collection ment for a group of individual objects where as
- *Map ment for a group of key-value pairs.
- Map is not Child interface of Collection.

Methods of Map Interface :-

* ① Object put(Object key, Object value);

→ To add key-value pair to the map

→ If the specified key is already available then old value will be replaced with new value & old value will be returned.

② Void putAll(Map m)

→ To add a group of key-value pairs.

* ③ Object get(Object key)

→ Returns the value associated with specified key

→ If the key is not available then we will get Null

④ Object remove(Object key);

⑤ boolean containsKey(Object key)

⑥ boolean containsValue(Object value)

⑦ int size();

⑧ boolean isEmpty();

⑨ Void clear();

① Set keySet();

② Collection values();

③ Set entrySet();

} Collection views of the Map.

Entry (Interface) :

- Each key-value pair is called One Entry
- Without Existing Map Object There is no change of Entry object
- Hence, Interface Entry is define inside Map Interfaces.

Code:

```
interface Map
{
    interface Entry
    {
        ①, Object getKey();
        ②, Object getValue();
        ③, Object setValue();
    }
}
```

(i) HashMap :-

- The underlying data structure is HashTable
- Heterogeneous Objects are allowed for both Keys & values.
- duplicate Keys are not allowed ~~for~~ but the values Can be duplicated.
- Insertion order is not preserved because it is based on Hash Code of Keys.
- null Key is allowed (only one)
- null values are allowed (any number of times).

Differences b/w HashMap & Hashtable :-

HashMap	Hashtable
<ul style="list-style-type: none">① No method is Synchronized② Multiple Threads Can Operates Simultaneously & Hence HashMap Object is not Thread Safe③ Threads are not required to wait & hence relatively performance is High.④ null is allowed for both key & value⑤ Introduced in 1.2 version & it is non-Legacy	<ul style="list-style-type: none">① Every method is Synchronized② At a time only one Thread is allowed to operate on ^{Hashtable} Objects. Hence it is Thread Safe.③ it increases waiting time of the Thread & Hence performance is low.④ null is not allowed for both key & values. otherwise we will get <u>NPE</u>⑤ Introduced, in 1.0 version & it is legacy

Q) How to get Synchronized version of HashMap?

Ans) → By default HashMap object is not Synchronized, but we can get Synchronized version by using `SynchronizedMap()` of `Collections` class.

```
Map m = Collections.synchronizedMap(HashMap hm);
```

Constructor :-

(i) `HashMap m = new HashMap();`

→ Creates an Empty HashMap Object with default initial capacity level is 16 & default fillRatio 0.75 (75%).

(ii) `HashMap m = new HashMap(int initialCapacity)`

(iii) `HashMap m = new HashMap(int initialCapacity, float fillRatio)`

(iv) `HashMap m = new HashMap(Map m)`

Ex: `import java.util.*;`

`class HashMapDemo`

`{`

`public void m(String[] args)`

`{`

`HashMap m = new HashMap();`

`m.put("chiranjeevi", 700);`

`m.put("balaiah", 800);`

`m.put("venkatesh", 1000);`

`m.put("nagarjuna", 500);`

`S.o.pln(m);` { venkatesh = 1000, balaiah = 800, Chiranjeevi = 700, nagarjuna = 500 }

`S.o.pln(m.put("chiranjeevi", 1000));` 700

`Set s = m.keySet();`

`S.o.pln(s);` [venkatesh, balaiah, chiranjeevi, nagarjuna]

`Collection c = m.values();`

`S.o.pln(c);` [1000, 800, 700, 500].

`Set S1 = m.entrySet();`

`Iterator its = S1.iterator();`

```
while (its.hasNext())
```

```
{
```

```
Map.Entry m1 = (Map.Entry) its.next();
```

```
S.o.pln(m1.getKey() + " --- " + m1.getValue());
```

```
if (m1.getKey().equals("nagarjuna"))
```

```
m1.setValue(10000);
```

```

nagarjuna 500
Venkatesh 1000
balakrish 800
chrisanjeevi 1000

```

```
}
```

```
S.o.pln(m);
```

nagarjuna = 10000, Venkatesh = 1000, balakrish = 800,
chrisanjeevi = 1000

ii) LinkedHashMap :-

→ It is the child class of HashMap.

→ It is exactly same as HashMap except the following differences

HashMap	LinkedHashMap
① The underlying D.S is HashTable	① The underlying D.S is HashTable + Linked List
② Insertion Order is not preserved	② Insertion Order is preserved
③ Introduced in 1.2 version	③ Introduced in 1.4 version

→ In the above program if we are replacing HashMap with Linked HashMap, the following is the o/p.

```
{chrisanjeevi = 1000, balakrish = 800, Venkatesh = 1000, nagarjuna = 500}
```

i.e insertion order is preserved

Note:-

→ The main application area of `LinkedHashSet` & `LinkedHashMap` are cache applications implementation where duplication is not allowed & insertion order must be preserved.

(iii) IdentityHashMap:-

→ It is exactly same `HashMap` except the following difference.

→ In the case of `HashMap` to identify duplicate keys JVM always uses `.equals()`, which is mostly meant for content comparison.

→ If we want to use `==` operator instead of `.equals()` to identify duplicate keys we have to use `IdentityHashMap`. (`==` operator always meant for reference comparison).

eg:- `HashMap m = new HashMap();`

`Integer i1 = new Integer(10);`

`Integer i2 = new Integer(10);`

`m.put(i1, "pavan");`

`m.put(i2, "Kalyan");`

`S.o.pln(m);` { 10 = Kalyan }

$I_1 \rightarrow 10$

$I_2 \rightarrow 10$

`.equals()` → Content

`==` → reference

$I_1 == I_2 \rightarrow \text{false}$

$I_1.\text{equals}(I_2) \rightarrow \text{True}$

→ In the above code I_1 & I_2 are duplicate keys because `i1.equals()` returns true.

→ If we replace `HashMap` with `IdentityHashMap` then the o/p is

{ 10 = pavan , 10 = Kalyan }

→ I_1 & I_2 are not duplicate keys because `i1 == i2` returns false.

WeakHashMap

- It is exactly same as HashMap except the following difference.
- In the case of HashMap, Object is not eligible for g.c even though it doesn't have any external references if it is associated with HashMap. i.e., HashMap dominates Garbage Collector (g.c).
- But in the case of WeakHashMap even though object associated with WeakHashMap, it is eligible for g.c, if it does not have any external references. i.e G.c dominates WeakHashMap.

Eg:- import java.util.*;

class WeakHashMapDemo

{

public static void main (String[] args) throws InterruptedException

{

HashMap m = new HashMap();

Temp t = new Temp();

m.put(t, "durga");

S.o.pln(m); {temp = durga}

t = null;

System.gc();

Thread.sleep(5000);

S.o.pln(m);

}

{temp = durga}

Class Temp

```
{  
    public String toString()  
    {  
        return "temp";  
    }  
    public void finalize()  
    {  
        System.out.println("finalize method called");  
    }  
}
```

o/p! {temp = durga}
{temp = durga}

→ If we replace HashMap with WeakHashMap then the o/p is

```
{temp = durga}  
finalize method called  
{ }
```

(i) Sorted Map (I) :-

- If we want to represent a group of entries according to some sorting order then we should go for SortedMap. The sorting should be done based on the keys but not based on the values.
- SortedMap Interface is the child Interface of Map.
- SortedMap Interface defines the following 6 specific methods
 - ① Object firstKey();
 - ② Object lastKey();
 - ③ SortedMap headMap(Object key1);
 - ④ SortedMap tailMap(Object key1);
 - ⑤ SortedMap subMap(Object key1, Object key2);
 - ⑥ Comparator comparator();

(ii) TreeMap (I) :-

- The underlying D.S is RED-BLACK Tree,
- Insertion order is not preserved & all entries are inserted according to some sorting order of keys.
- If we are depending on default natural sorting order then the keys should be homogeneous & Comparable. otherwise we will get ClassCastException (CCE).
- If we are defining our own sorting order by Comparator then

The Keys need not be Homogeneous & Comparable.

→ There are no restrictions on values, they can be Heterogeneous & Non-Comparable.

→ duplicate Keys are not allowed but values can be duplicated.

Null acceptance:-

→ For the Empty TreeMap as the first entry ^{with} null key is allowed. but after inserting that entry if we are trying to insert any other entry we will get NullPointerException (NPE).

→ For the Non-Empty TreeMap if we are trying to insert entry with null key we will get NullPointerException (NPE).

⇒ There are no restrictions on null values. i.e., we can use null any no. of times anywhere for Map values.

Constructors:-

(i) `TreeMap t = new TreeMap()`

for default natural Sorting order.

(ii) `TreeMap t = new TreeMap(Comparator c)`

for Customized Sorting order.

(iii) `TreeMap t = new TreeMap(Map m)`

(iv) `TreeMap t = new TreeMap(SortedMap m)`

Eg:- import java.util.*;

class TreeMapDemo3

{

public static void main (String[] args)

{

TreeMap m = new TreeMap();

m.put (100, "zzz");

m.put (103, "yyy");

m.put (101, "xxx");

m.put (104, 106);

m.put (107, null);

// m.put ("FFFF", "xxx"); // CCE

// m.put (null, "xxx"); // NPE

S.o.pln(m); // { 100 = zzz, 101 = xxx, 103 = yyy, 104 = 106, 107 = null }

}

}

o/p:-

{ 100 = zzz, 101 = xxx, 103 = yyy, 104 = 106, 107 = null }

eg:-

import java.util.*;

class TreeMapDemo

{

p.s.v.m(String[] args)

{

TreeMap t = new TreeMap(new MyComparator());

t.put("xxx", 10);

t.put("AAA", 20);

t.put("zzz", 30);

t.put("LLL", 40);

S.o.pln(t);

}

class MyComparator implements Comparator

{

public int compare(Object obj1, Object obj2)

{

String s1 = obj1.toString();

String s2 = obj2.toString();

return s2.compareTo(s1);

}

}

o/p:-

{ zzz = 30 , xxx = 10 , LLL = 40 , AAA = 20 }

Hashtable() :

- The underlying datastructure is HashTable.
- Heterogeneous objects are allowed for both keys & values
- Insertion order is not preserved & it is based on Hash Code of the keys.
- null is not allowed for both key & values otherwise we will get `NullPointerException (NPE)`.
- Duplicate keys are not allowed, but values can be duplicated.
- All methods are Synchronized & hence HashTable object is Thread Safe.

Construction :

(i) `Hashtable h = new Hashtable()`

- Creates an empty Hashtable object with default initial capacity is "11" & default fill ratio 75% (0.75).

(ii) `Hashtable h = new Hashtable (int initialCapacity)`

(iii) `Hashtable h = new Hashtable (intinitialCapacity, float fillratio)`

(iv) `Hashtable h = new Hashtable (Map m)`

Eg:- import java.util.*;

Class HashtableDemo

```

{
    P.S. v.m (String[] args)
    {
        Hashtable h = new Hashtable();
        h.put (new Temp(5), "A");
        h.put (new Temp(2), "B");
        h.put (new Temp(6), "C");
        h.put (new Temp(15), "D");
        h.put (new Temp(23), "E");
        h.put (new Temp(16), "F");
        // h.put ("duvaga", null); // NPE
        System.out.println(h);
    }
}

```

10	
9	
8	
7	
6	6=C
5	5=A, 16=F
4	15=D
3	
2	2=B
1	23=E
0	

{ 6=C, 16=F, 5=A, 15=D, 2=B, 23=E }

Class Temp

— from top to bottom & Right to Left

```

{
    int i;
    Temp(int i)
    {
        this.i = i;
    }
    public int hashCode()
    {
        return i;
    }
    public String toString()
    {
        return i + " ";
    }
}

```

*) Properties(C):-

- It is the child class of Hashtable
- In our program if any thing which changes frequently (like database usernames, passwords, URL) never recommended to hardcode the value in the Java program. Because for every change, we have to recompile, rebuild, redeploy the application & sometime even server restart also required. which creates a big business impact to the client.
- we have to configure those variables (properties) inside properties files & we have to read those values from java code.
- the main advantage of this approach is, If any change in the properties file just redeployment is enough which is not a business impact to the client.

Constructor:-

(i) `Properties p = new Properties();`

→ In the case of Properties both key & value should be String type

Methods:-

* (i) `String getProperty(String propertyName)`

→ returns the value associated with specified property.

(ii) `String setProperty(String pname, String pvalue);`

→ to set a new property.

(iii) ~~String~~ Enumeration propertyNames();

* (iv) void load(InputStream is)

→ To load the properties from properties files into java properties object.

(v) void store(OutputStream os, String Comment)

→ To update properties from properties object into properties file.

Eg:- import java.util.*;

import java.io.*;

class PropertiesDemo

{

public static void main(String[] args) throws IOException

{

Properties p = new Properties();

FileInputStream fis = new FileInputStream("abc.properties");

p.load(fis);

System.out.println(p);

String s = p.getProperty("venki");

S.o.pln(s);

p.setProperty("nag", "999999");

FileOutputStream fos = new FileOutputStream("abc.properties");

p.store(fos, "Updated by dunga for Scpp Demo class");

}

}

user = scott venki = 8888 pwd = tiger

abc.properties
