

## **On Project Introduction:**

Currently I am working on .....project which mostly on ecommerce/XYZ domain. Here basically any user can buy products through our website which is the activity of electronically buying or selling of products online services over the Internet.

This application is the one-stop solution to cater to the needs of customers and shopping through our websites.

A sophisticated and easy-to-use shopping cart control panel is available, with a "Search anything" feature. In addition to that I worked on many modules/features like Home page, Search feature with different -different categories, product page, Product detail page, cart, email so on.

And we are using agile environment with 2 weeks of sprint cycle. We use JIRA tool to accommodate all the requirements and testing activities.

I involved mostly all the testing activity from start to end in this project as like---  
[Add your roles and responsibility]

My roles and responsibility is to understand Business Requirement Specification and High-Level scenarios and to convert them into test cases & Automation scripts if required. Execution of test cases and reporting of defect to the developer if there any and get them fixed.

I have experience on Functional, Automation, Regression, Smoke, Sanity, Web accessibility, Web Analytics, Mobile Testing. In my previous project I have worked on Automation testing where we have used Selenium with java and TestNG Cucumber framework for BDD approach.

We have used Page object model where we have separated our test cases with page objects, and we performed testing on the same. For build management tool we are using Maven for version controlling we are using Git and for automating our jobs for nightly run or any schedule we are using Jenkins. My goal is to build a successful career as a software Tester, which can help my company and me personally.

Thanks ,
